

1. LinkedIn Post Draft (Optimized for Feed Retention)

Most e-commerce demos stop at UI. I built Luxurisen to focus on backend resilience, distributed caching, and tamper-proof transactional architecture under the hood.

Stack: React 19, Vite, Tailwind CSS 4, Node/Express 5, MongoDB, Redis (ioredis). Deployed on Render.

Key engineering highlights:

- Distributed Redis Layer: Caches catalog and review endpoints (5–10 min TTL with X-Cache headers) and enforces cross-instance rate limiting via rate-limit-redis (200 req/15m global, 10 req/15m auth), gracefully falling back to in-memory limits and DB queries if Redis disconnects.
- Tamper-Proof Logic: Discount caps, expiry, and cart thresholds are calculated strictly server-side. Razorpay signatures are verified before coupon usage counters atomically increment.
- Catalog & Roles: Buyer/seller RBAC with route guards, Google OAuth + JWT in httpOnly cookies, multi-attribute product variants, ImageKit CDN pipelines, and detailed order audit histories.

(Note: This is a portfolio/educational project — no real commercial transactions take place.)

How do you typically handle distributed rate limiting and cache invalidation across services? I'd love to hear your feedback and approaches in the comments!

2. Recommended Visual Placement Sequence

Slide / Media	Asset Name	Context & Purpose
Video / Slide 1	Interactive Recording (30-45s)	End-to-end user flow (catalog "" variant "" cart "" checkout).
Slide 2	01_homepage_hero.png	Editorial hero slider with Cormorant Garamond typography.
Slide 3	02_the_edits_carousel.png	Interactive 3D Depth Carousel with collection drops.
Slide 4	04_product_detail.png	Product variant matrix (size/stock/price) & ImageKit CDN gallery.
Slide 5	05_cart_page.png	Server-authoritative cart summary & promo code engine.
Slide 6	06_auth_login.png	Dual-role authentication portal (Google OAuth + JWT cookies).
Slide 7	08_homepage_mobile.png	Mobile viewport (375px) responsive showcase.
